Demographic change approach:

Demographic change approach: multiply number of people with diagnosed diabetes from 2020-2030 (from IDF estimates) by proportion of people anticipated to be treated with insulin given current estimates (from NHANES) by amount of insulin per person (given distribution of body weights in NHANES).

Demographic change plus improved insulin access:

calculate additional number of people with diabetes not yet on insulin who would be diagnosed if US reached highest OECD country diagnosis level (UK, at 81.5% diagnosis per IDF Diabetes Atlas 9th edition). Estimate insulin necessary given current ADA-EASD guidelines (i.e. start with metformin, then either metformin+ SU, +TZD, +DPP-4, +SGLT-2, or +GLP-1RA). The base case should target HbA1c of 7%. [Sensitivity analyses not yet done: (i) For increased age or significant comorbidities, loosen target to 8%. (ii) try three orals before insulin.]

Match NHANES People to MEPS to get imputed insulin dispensed
